

GenZ Social Media Analysis Report

Prepared by: Aashish Kapadia

Date: May 2026

Tools Used: Python (Pandas), Tableau, Microsoft Word

Dataset: Kaggle [Gen-Z Social Media Usage Dataset](#)

Summary:

This report provides a comprehensive analysis of social media usage patterns among Generation Z across seven countries: India, USA, Canada, UK, Germany, Brazil, and Australia. The dataset spans over 1,000,000 user records and examines platform preference, addiction levels, usage purpose, time-of-day behaviour, gender dynamics, and mental health correlations.

Key insights:

- Instagram leads in average session minutes (7M total), and also records the highest aggregated mental health scores, suggesting a complex relationship between engagement and wellbeing.
- Medium addiction is the dominant classification (590K users), with High (160K) and Low (250K).
- Entertainment is the primary usage purpose, with 400K users and 1.4M daily usage hours attributed to it.
- India accounts for the largest user base (355K) and highest night-time usage (215K sessions), signalling significant behavioural risk in that market.
- Gender distribution is near-equal: Female 48.01%, Male 47.96%, Other 4.03%.
- Screen time before sleep is paradoxically highest in the medium addiction group, likely due to sheer population size.

Visualization & Analysis:

1. Platform Popularity:

Observation:

This is the Radial Chart that represent the no of users used most platform by its users count from all seven country from dataset:

- **Instagram** is the most popular platform with 2,99,927 Users.
- **YouTube & TikTok** is the 2nd most popular platform with more than 2,50,000 Users.
- **Twitter** is the 3rd highest most used platform with more than 1 lakhs Users.
- **Snapchat** have least popular platform based with 99K+ Users.

2. Addiction level distribution:

Observation:

This bar chart shows the level of Addiction and their proper distribution by proper colour it.

Key Colour:

- Low: Green ●
- Medium: Yellow ●
- High: Red ●

Key Insights:

1. The Chart display that the maximum no of users falls under Medium Level of addiction with around 5,89,843.
2. The 2nd most users come under the low addiction with around 2,51,220.
3. The lowest no of users archived High Level of Addiction around 1,58,937.

3. Gender vs Addiction Level:

Observation:

This is Chart gave a proper insight of Gender Vs Addiction Level By proper distribution of Addiction level with its gender type with proper insight by colour:

Key Colour:

- **Male** – Blue ●
- **Female** – Pink ●
- **Other** – Green ●

Key Points are:

1. The Medium Addiction is the highest in all types of gender.
2. The Male and Female in Medium level are having approximate very near to each other were as others are very low.
3. The Low Addiction Level is the 2nd high were Male and Female are slightly difference and Other are still very low compare to Male and Female.
4. The High Addiction is lowest in Male and Female and still slightly similar in were other are still low.
5. The Male score in all Addiction level is:
 - a. High – 76K+
 - b. Medium – 2,83,147
 - c. Low – 1,20,377
6. The Female Score in all Addiction level are:
 - a. High – 76K+
 - b. Medium – 2,82,991
 - c. Low – 1,20,723
7. The Other Score in all Addiction level are:
 - a. High – 6,486
 - b. Medium – 23K+
 - c. Low – 10K+

4. Usage purpose:

Observation:

This Chart display the purpose of usages why Genz spend more time and what type of content they preferred on the social media.

We have subcategory of the data where we can difference by their colours:

- Entertainment – Red ●
- News – Cyan ●
- Socializing – Green ●
- Education – Orange ●
- Content Creation – Blue ●

Key Insight:

1. The Genz use the social media to get Entertainment purpose with highest around 4 Lakhs points.
2. The 2nd most viewed things are Socializing with 2,50,239 points.
3. The 3rd most viewed things are Education Purpose to gain knowledge around 2 Lakhs points.
4. The 4th most viewed is News to get the current affair and current awareness with around 99K+ points.
5. The last is Content Creations with around 49K+ points where genz create content on social media.

5. Users By Country:

Observation:

This Chart displays the highest users base from all seven country all over the different platforms. Each country defines its own unique colours.

Key colour:

- **India** – Green
- **USA** – Purple
- **Canada** – Red
- **UK** – Yellow
- **Germany** – Cyan
- **Brazil** – Orange
- **Australia** – Blue

Key Insight:

1. **India** is had highest users bases across the seven countries with top leading with 3,50,321 Lakhs.
2. **USA** have stand 2nd in list with users base of 1,99,740
3. **Canada** have 3rd in list countries with users base of 1 Lakhs above.
4. **UK** have 4th in list of countries with users base of 1 lakh only.
5. **Germany & Brazil** have slightly difference in its users bases with 99K+ users.
6. **Australia** has least number of users base as compare to other countries with having 49K+ users which is half of Germany and Brazil.

6. Gender Distribution:

Observation:

The Pie charts represent Gender distribution with the platform users' base filters. Were the **Female** capture **48.01%** slightly higher than **Male** with **47.96%** and **Other** have very less area capture with **4.03%** all over the chart the colour distribution is used to distribute the Gender.

The filters are also used to see the Gender uses over platform where the conclusion is that Male and Female have slightly difference in using platforms.

Were the platform being:

1. Instagram:

- a. Male: 47.97%
- b. Female: 47.98%
- c. Other: 4.05%

2. Snapchat:

- a. Male: 48.05%
- b. Female: 47.82%
- c. Other: 4.13%

3. Tik Tok:

- a. Male: 47.90%
- b. Female: 48.09%
- c. Other: 4.02%

4. Twitter:

- a. Male: 48.03%
- b. Female: 47.96%
- c. Other: 4.00%

5. YouTube:

- a. Male: 48.07%
- b. Female: 47.94%
- c. Other: 3.99%

7. Average session minutes by platform:

Observation:

This chart gives an info of how Average users spend lots of time on which platform the users spend their time and distribute according to colour.

Keys colour according to platform are:

- **Instagram** – Pink
- **Snapchat** – Yellow
- **Tik Tok** – Brown
- **Twitter** – Blue
- **YouTube** - Red

Key Insight:

1. Instagram have highest Averages time spend over other platform with lead of 7 lakhs+.
2. YouTube & Tik Tok have 2nd and 3rd position holding slightly difference but both are 6 lakhs+ average users times.
3. Snapchat & Twitter have slightly difference but still come in range more than 2 lakhs of average time holding in it.
4. By above details we can see that Instagram have highest rich to users.
5. YouTube and Tik Tok are competitive with each other over user's time spending over their platform so YouTube release new features to take down the Tik Tok by adding YouTube Shorts for Short/Fastest Content.
6. Genz used Snapchat for his epic features like snap strikes and its camera filters where else twitter is used for social topic and news and debate over a social media.

8. Screen time before sleep by addiction level:

Observation:

This chart clearly tells a different story of addiction of users towards screen time before they sleep. We can also perform user distribution in level of addiction; we need to get the user pattern with it.

Key points are:

1. Medium Level has the highest in addiction score over 5 Lakhs + Users.
2. Low Level comes after medium level with 2 lakhs users.
3. High level has the least users with 1 Lakhs+ users.

9. Mental health score by platform:

Observation:

1. **Instagram** dominates with the highest mental health score (2.15M), which could mean it's the most-used platform among the study population, or that its users report more mental health concerns — worth investigating further.
2. **TikTok** and **YouTube** are tied at 1.8M each. Both are video-first platforms with highly engaging, algorithm-driven feeds, which may explain their similar impact profiles.
3. **Snapchat** and **Twitter** score the lowest (700K each). These platforms tend to be more ephemeral or text-heavy, which may correlate with a different type of mental health interaction — or simply lower user representation in the dataset.

10. Number of platforms used by gender:

Observation:

The **Tree map** is used to display the users with their gender and platform used. Like in this chart, we clearly see that Female of Instagram and Male in Instagram have dark blue color that shows proper hung users and the little color indicates a less users with divided in particular over gender and platform users. So in the chart, we see both Platform users and gender preferred most.

Key insight:

1. Dark Blue color are in Instagram from both male and Female.
2. Mid Dark Blue color in YouTube & Tik Tok are used in both Male and Female.
3. Light Blue is used in Twitter & Snapchat that show less users compare to previous users.
4. Sky Blue show the least platforms by other gender.

11. Daily usage hours by purpose:

Observation:

This bar chart shows the proper uses of Daily Usage hours by purposes where genz spend on that clearly show that:

Key points:

1. Entertainment — 14,00,000 hrs/day (dominant by far)
This is 14 lakh daily hours, not 3 lakhs. Entertainment towers above all other purposes — nearly 1.6× more than socializing and 2× more than Education. Gen Z clearly treats social media primarily as a leisure and content consumption tool.
2. Socializing — 8,80,000 hrs/day
Nearly 9 lakh daily hours, not 2 lakhs. Socializing is a strong second — social media lives up to its name as a connector tool. The gap between Entertainment and Socializing is large but socializing comfortably beats all remaining purposes.
3. Education — 7,00,000 hrs/day
Around 7 lakh daily hours, not 1 lakh. Notably close to Socializing in magnitude. This shows Gen Z is also actively using social media for learning — YouTube tutorials, educational TikToks, and Instagram infographics all contribute here.
4. News — 3,40,000 hrs/day · Content Creation — 1,70,000 hrs/day
News sits at 3.4 lakh and Content Creation at 1.7 lakh daily hours. These are the two niche purposes — significant in absolute terms but far behind the top three. Your prediction is valid: as creator culture grows, Content Creation hours are likely to rise in coming years.

12. Addiction level by country:

Observation:

This chart shows proper Addiction level by Country level and its uses

Key observations:

1. India dominates all three addiction tiers

High 55K Low 1,10K Medium 2,10K

India is the single largest contributor across every addiction level — by a massive margin. The Medium tier bar (2,10,000) is nearly 4× larger than any other country's bar in that category, reflecting India's enormous Gen Z population using social media.

2. Medium addiction is the most prevalent tier globally

Across all countries, the Medium (yellow) bars are consistently the longest — followed by Low, then High. This suggests most Gen Z users are moderately addicted to social media rather than severely or minimally. A healthy-but-concerning middle ground.

3. USA ranks 2nd in both High and Medium tiers

High 28K Medium 1,20K

After India, the USA shows the next highest counts — particularly notable in medium addiction (1,20,000). This places the USA as the second most at-risk country in this dataset.

4. Australia, UK, Germany shows the lowest counts across all tiers

These three countries consistently have the shortest bars — particularly in the High addiction tier (10K–20K range). Smaller populations and possibly stronger digital wellness awareness may contribute to lower absolute counts.

5. Brazil and Canada cluster closely together

Both countries sit in a consistent mid-range band (20K–60K) across all three addiction tiers — neither extreme. They represent a "typical" pattern without India and USA's outlier effect skewing the picture.

6. High addiction is the smallest tier — but India and USA still lead it

Even in the most severe category (High — red), India (55K) and USA (28K) stand out. This is a concern because High addiction users are most at risk for negative mental health outcomes linked to excessive social media use.

13. Platform preference by country:

Observation:

The Bubble charts display a proper platform uses leading country:

Key Insight:

1. India commands the two largest bubbles in the entire chart

YouTube India Instagram India India's sheer population size drives YouTube and Instagram to outsize proportions. YouTube India being the single biggest bubble is striking — it suggests video consumption is the #1 social media behaviour for Indian Gen Z.

2. USA is the strongest non-India presence

Instagram USA YouTube Saitek USA the USA appears prominently across Instagram, YouTube, and TikTok — all three as notably large bubbles. This reflects a highly multi-platform Gen Z culture in the US, with no single dominant platform as extreme as India's YouTube preference.

3. TikTok has the most scattered, distributed presence

TikTok IndiaTikTok USATikTok (others)TikTok bubbles appear across many countries — more so than any other platform. This signals TikTok's truly global reach within Gen Z, even if no single TikTok bubble rivals India's Instagram or YouTube in size.

4. Twitter appears in medium-sized clusters – not dominant, not absent

Twitter Multiple blue Twitter bubbles are scattered on the left side. They are mid-sized — consistently present across countries but never the top platform in any country. Twitter serves as a secondary platform for Gen Z globally.

5. Snapchat has the smallest and fewest bubbles

Only one clearly labelled Snapchat bubble appears — small and yellow — confirming Snapchat is the least preferred platform across all countries in this Gen Z dataset. This is consistent with every other chart in this analysis.

6. Bubble = user count, not percentage — India's population inflates its bubbles

It's important to note that bubble size reflects absolute user counts. India and USA having the largest bubbles partly reflects their massive populations. Per-capita, other countries may have equally strong or stronger platform preferences — this chart shows volume, not intensity.

14. Night usage by country:

Observation:

The 3-tier structure is the most important pattern:

Tier	Country	Night Usage
Tier 1	India	3,50,000
Tier 2	USA	2,00,000
Tier 3	Canada, Germany, UK, Brazil	1,00,000 each
Bottom	Australia	55,000

Key Insight:

1. India leads night usage by a massive margin — 3,50,000:
2. USA is a clear second at 2,00,000 — a big gap from the rest
3. Canada, Germany, UK and Brazil form a tight mid-tier cluster at 1,00,000
4. Australia has the lowest night usage at 55,000:
5. High night usage links directly to addiction and mental health risk.
6. The chart is sorted by usage — reveals a clear 3-tier structure:
 - a. Tier 1: India alone (3,50K)
 - b. Tier 2: USA alone (2,00K) .
 - c. Tier 3: Canada, Germany, UK, Brazil (1,00K each) .
 - d. Bottom: Australia (55K).

Conclusion & Final Key:

1. India is the defining market:

India leads every single metric — users (3,50,321), night usage (3,50,000), addiction (all 3 tiers), platform bubbles, and country counts. With a massive Gen Z population and growing internet penetration, India's patterns will shape global social media trends for the next decade.

2. Instagram is the dominant platform — but YouTube rules India:

Globally, Instagram leads in users (2,99,927), session time (7L+ mins), and mental health scores (2.15M). But the bubble chart reveals a striking exception — YouTube India is the single largest country-platform bubble, showing that video content has overtaken image-social for Indian Gen Z.

3. Entertainment dominates — but education is surprisingly strong:

Entertainment commands 14 lakh daily hours — nearly 1.6× Socializing. But Education at 7 lakh daily hours is nearly as large as Socializing (8.8L), a finding that challenges the narrative that Gen Z uses social media only for leisure. YouTube tutorials, TikTok explainers, and Instagram infographics are genuine learning tools.

4. Medium addiction is the global norm — but High is still a crisis:

58.9% of users fall in Medium addiction, which may seem reassuring. But 1,58,937 High-addiction users represent a significant at-risk population — concentrated in India (55K) and USA (28K). The night usage data reinforces this: the same countries with highest night scrolling have the most High addiction cases.

5. Gender is almost perfectly equal — a unique Gen Z characteristic:

Female (48.01%), Male (47.96%), Other (4.03%) — across every platform, the gender split stays within 0.1–0.3% of each other. This near-perfect parity is remarkable and distinct from older generations. Gen Z has truly democratised social media use across gender lines, with only minor platform-specific skews (e.g. Instagram slightly more female, YouTube slightly more male).
