

GENZ SOCIAL MEDIA ANALYSIS

Tableau & Data Analytics Report

Editable portfolio-ready report

Project Element	Details
Project	GenZ Social Media Analysis
Business Domain	Social Media / Digital Behavior Analytics
Tool	Microsoft Power BI
Dataset Scope	1,000,000 users across 7 countries
Analysis	Platform popularity, addiction, gender, purpose and country distribution
Prepared By	Aashish Kapadia

1. Executive Summary

This project presents a GenZ Social Media Analysis solution developed in a Power BI-style business intelligence format. The objective is to evaluate platform popularity, addiction levels, gender patterns, usage purpose and geographic distribution, and convert the dashboard into practical behavioral insights.

The supplied dashboard represents 1,000,000 users across 7 countries. The KPI cards show average daily usage of 3.51 and a High-addiction share of 15.89%. Medium addiction is the largest category, while Entertainment is the leading stated usage purpose. India is the largest country segment, followed by the USA.

2. Business Problem

Organizations, educators and digital-product teams need a clear view of how GenZ users interact with social platforms and where usage patterns may require responsible-engagement or digital-wellbeing attention.

- Measure the overall GenZ user base and average daily usage.
- Identify the distribution of Low, Medium and High addiction levels.
- Compare addiction patterns by gender.
- Understand the main purposes for social-media use.
- Compare user concentration across countries.
- Translate platform, demographic and geographic findings into actionable strategies.

3. Dataset & Methodology

Area	Fields / Categories	Use in Analysis
Platform	Primary Platform: Instagram, Snapchat, TikTok, Twitter, YouTube	Compare platform popularity.
Addiction	Addiction Level: Low, Medium, High	Measure distribution and identify dominant segment.
Demographics	Gender: Female, Male, Other	Compare addiction patterns by gender.
Purpose	Entertainment, Socializing, Education, News, Content Creation	Identify leading reasons for usage.
Geography	Country: India, USA, Canada, UK, Germany, Brazil, Australia	Compare user concentration by country.
Measures	User count, daily usage, category counts	Support KPI and descriptive analysis.

The analysis is based on the dashboard screenshots supplied in the conversation. Values that cannot be read exactly from the visuals are treated as approximate visual estimates. The analysis is descriptive and does not claim causation between usage purpose, platform behavior and addiction.

4. Key Performance Indicators

KPI	Dashboard Value	Interpretation
Total Users	1,000,000	Total displayed GenZ user population.
High Addiction	15.89%	Share of users in the High addiction category.
Avg Daily Usage	3.51	Displayed average daily usage; unit/time basis should be validated.
Countries	7	Number of countries represented.
Largest Country	India ≈ 350K	Largest displayed country user segment.
Largest Purpose	Entertainment ≈ 400K	Largest displayed usage-purpose category.

The KPI values above are taken from the supplied dashboard cards and visuals. Exact units for Average Daily Usage and exact category totals should be confirmed against the underlying dataset before formal publication.

5. Dashboard Analysis

5.1 Platform Popularity

The platform donut chart shows five primary platforms: Instagram, Snapchat, TikTok, Twitter and YouTube. The slices appear comparatively balanced, indicating that the supplied view does not show one platform overwhelmingly dominating the displayed user population.

Figure 1. Platform Popularity — supplied dashboard visual.

5.2 Addiction Level Distribution

Medium addiction is the largest category at roughly 590K users, followed by Low at approximately 250K and High at approximately 160K. The broad Medium segment is therefore the main population for prevention, awareness and healthier-usage initiatives.

Figure 2. Addiction Level Distribution — supplied dashboard visual.

5.3 Gender & Addiction Analysis

Female and Male counts are broadly similar in the High and Medium groups, while the Other category is much smaller. The Medium group is visibly the largest for both Female and Male users.

Figure 3. Gender vs Addiction Level — supplied dashboard visual.

5.4 Usage Purpose Analysis

Entertainment is the leading purpose at approximately 400K users. Socializing follows at around 250K, Education at 200K, News at 100K, and Content Creation at about 50K. Entertainment and Socializing are therefore the dominant stated use cases in the supplied population.

Figure 4. Usage Purpose — supplied dashboard visual.

5.5 Geographic & Consolidated Dashboard Analysis

India is the largest country segment at roughly 350K users. The USA contributes around 200K, while Canada, the UK, Germany and Brazil are each around 100K and Australia around 50K. The consolidated dashboard combines country, addition, purpose, platform and gender views into one decision-support layout.

Figure 6. GenZ Social Media Analysis — consolidated supplied dashboard.

6. Category / Dimension Analysis

Dimension	Main Categories	Displayed Signal	Business Interpretation
Platform	Instagram, Snapchat, TikTok, Twitter, YouTube	Relatively balanced visual mix	Avoid assuming one-platform dominance; validate exact shares.
Addiction	Low, Medium, High	Medium is dominant; High = 15.89%	Focus wellbeing and prevention efforts on the large Medium segment.
Gender	Female, Male, Other	Female and Male dominate	Use gender segmentation without assuming causation.
Purpose	Entertainment, Socializing, Education, News, Content Creation	Entertainment leads	Prioritize the largest use cases in engagement and wellbeing design.
Country	India, USA, Canada, UK, Germany, Brazil, Australia	India leads	Use country-specific strategies based on audience concentration.
Usage	Average Daily Usage = 3.51	Displayed KPI	Validate unit/time basis before external reporting.

7. Regional / Country Analysis

Country	Approx. Users	Observation
India	≈ 350K	Largest displayed user segment.
USA	≈ 200K	Second-largest displayed segment.
Canada	≈ 100K	Mid-sized displayed segment.
UK	≈ 100K	Mid-sized displayed segment.
Germany	≈ 100K	Mid-sized displayed segment.
Brazil	≈ 100K	Mid-sized displayed segment.
Australia	≈ 50K	Smallest displayed country segment.

Country concentration is uneven. India represents the largest displayed user base and the USA the second-largest. The remaining countries form smaller but meaningful segments. This concentration should be considered when designing market-specific engagement, education and responsible-use initiatives.

8. Customer / User Analysis

The user analysis indicates a very large population with average daily usage of 3.51. The dashboard separates users by gender, addiction level, platform and purpose, allowing a multidimensional view rather than relying on total user count alone.

The strongest analytical segment is the Medium addiction group. Because Female and Male counts are both large within this category, interventions should not be designed around a single gender assumption.

9. Usage & Addiction Analysis

Signal	Dashboard Evidence	Interpretation / Action
High addiction	15.89% of 1,000,000 $\approx$ 159K	Substantial minority; monitor and support healthier usage.
Medium addiction	$\approx$ 590K	Largest segment; strongest prevention and awareness opportunity.
Entertainment	$\approx$ 400K	Largest stated purpose; dominant engagement context.
Socializing	$\approx$ 250K	Second-largest purpose; important for social interaction features.
Education	$\approx$ 200K	Meaningful use case; supports productive engagement pathways.
News	$\approx$ 100K	Smaller but material information-use segment.
Content Creation	$\approx$ 50K	Smallest displayed purpose; potential creator-focused niche.

The dashboard alone does not establish causation between purpose and addiction. Any claim about relationships between these variables would require statistical testing using the underlying dataset.

10. Key Business Findings

- Total user population is 1,000,000 across seven countries.
- High addiction accounts for 15.89% of users; Medium is the largest addiction category.
- Average daily usage is shown as 3.51 in the dashboard.
- Entertainment is the leading usage purpose, followed by Socializing and Education.
- India is the largest country segment, with the USA second.
- Female and Male users form the dominant gender groups across addiction levels.
- The five displayed platforms have a relatively balanced visual distribution.

11. Business Recommendations

Priority	Recommendation	Why It Matters
1	Prioritize responsible-use and digital-wellbeing initiatives around the Medium addiction segment.	It is the largest displayed addiction group.
2	Use country-specific strategies, especially for India.	India is the largest displayed user market.
3	Design engagement around Entertainment and Socializing while supporting healthier usage.	These are the two largest stated purposes.
4	Monitor High-addiction users with non-invasive awareness and time-management features.	High addiction represents 15.89% of the population.
5	Segment dashboards by gender, country and platform before making interventions.	Avoid one-size-fits-all decisions.
6	Validate platform shares and all approximate values against the source model.	Screenshots do not provide every exact underlying value.

12. Technical Skills Demonstrated

- Power BI dashboard design and visual storytelling
- Data aggregation and KPI development
- Categorical segmentation and comparative analysis
- Bar, donut, grouped-bar and dashboard layout design
- Demographic and geographic analysis
- Business interpretation and recommendation writing
- Portfolio-oriented reporting and documentation

13. Limitations & Validation

- The report is grounded in supplied dashboard screenshots rather than an independently audited raw dataset.
- Several numeric values are approximate visual readings.
- The dashboard does not by itself establish causal relationships between social-media usage and addiction.
- Validate all displayed counts and percentages against the source data before publication.
- Confirm the unit and time basis of Average Daily Usage (3.51).
- Use statistical testing if relationships between gender, purpose, platform and addiction are to be presented as significant.
- Check whether country and category totals reconcile exactly to the one-million-user KPI.

14. Conclusion

The GenZ Social Media Analysis dashboard provides a clear overview of platform usage, addiction levels, user purpose, gender patterns and country concentration. The most important management signal is the size of the Medium addiction population and the 15.89% High-addiction share. Entertainment and Socializing dominate stated purposes, while India represents the largest country segment.

For a portfolio project, the dashboard demonstrates the ability to transform a large user dataset into a concise analytical story and connect visual findings to practical business and digital-wellbeing recommendations.

Appendix – Suggested KPI / DAX Definitions

Metric	Conceptual Definition
Total Users	DISTINCTCOUNT(User ID) or COUNTROWS(User Table), depending on the data model.
High Addiction %	High Addiction Users / Total Users.
Average Daily Usage	AVERAGE(Daily Usage).
Country Count	DISTINCTCOUNT(Country).
Purpose Share	Users by Purpose / Total Users.
Platform Share	Users by Primary Platform / Total Users.
Gender Share	Users by Gender / Total Users.
Addiction Share	Users by Addiction Level / Total Users.
